Powerstation psx2 charging light flashing

© 1996-2014, Amazon.com, Inc. or its affiliates Q: The battery does not charge or does not charge? Answer: The battery needs to be charged regularly, even when not in use. The battery must be charged at least once a month. Failure to do so may result in damaged cells and the battery not charging or holding a charge. The battery may also be damaged if the correct procedure for jumping the vehicle is not followed. Q: Will they be charged? A: The batteries are fully charged at the factory, but they will lose charge over time. New devices must be charged before first use and at least once a month between use. The first charge can take up to 72 hours or until the charging light is activated. Q: What if my battery is completely emptied on my vehicle? A: This item is a booster and does not start a vehicle with a completely dead battery. Q: How to dispose of Kickstart? A: The jump launcher contains a sealed lead acid battery and must be reused like any other battery. Follow local rules for proper disposal. Q: Can I replace the battery? A: No. There are no parts that can be serviced by the user in this device. Q: How do I test my kickstart battery? A: In some models to check if the battery is charging, press the battery symbol button or battery test button. In other models, press the battery test for the volt meter. If it reads in the green, the battery is charged. Q: How do I connect my kickstarter to my vehicle? Answer: See the vehicle owner's guide to kickstarting instructions and to determine if you have a negative ground system (most commonly) or a positive ground system. If the device is equipped with an on/off button, make sure the switch is turned off. Connect the red clamp to the positive (+) battery terminal. The black clamp shall be attached to the engine block or any other non-moving metal part of the blocked vehicle. Do not connect the black clamp to the negative (-) battery terminal. Doing so may damage the device and/or create an explosion hazard. Turn the main switch to the on position. If the device is equipped with an on/off button, make sure the switch is turned off. Connect the black clamp to the positive (+) battery terminal. The red clamp shall be attached to the engine block or any other non-moving metal part of the blocked vehicle. Do not connect the red clamp to the negative (-) battery terminal. Doing so may damage the device and/or create an explosion hazard. Turn the main switch to the on position. Q: Will the battery test button tell me how to charge my car battery? A: The battery test button only tells you the state of the jump launcher battery. It won't tell you the charging mode of your car battery. Q: Why does my jumpstart make a buzzing sound? A: Some jumpstart models are equipped with an alarm indicating low battery voltage. If charging the battery does not the buzzing alarm, the battery may be at the end of its life. Turn on the air air and work lights will speed up the process of draining the battery and dampening the alarm. Jumpstart must then be disposed of in accordance with local regulations. Q: What if I back cables? NOTE: IT IS VERY IMPORTANT TO REVIEW WARNING AND SAFETY INSTRUCTIONS BEFORE USE!! Answer: If cables are connected to the wrong battery terminal, the reverse LED turns on and a warning tone sounds (if equipped). If this happens, correct the connection before proceeding to the next step. Failure to do so may result in sparks, personal injury and/or damage to the vehicle or starting unit. My Jumpstarter shows charged but doesn't work. Answer: The power button must be on TO position. The power switch (if equipped) should only be set in the on position when attempting to jump in a vehicle. The charging light doesn't turn on when charged from the vehicle's DC charge just 2 hours at a time – it damages your jump starter battery if connected longer. Charging wires are stored inside the device. Check the storage compartment located on the device for the 120V AC extension cord or 12V DC man for male power cord (if equipped). Many standard ac extension cords can also be used to charge the jumpstarter as well. Jumpstarter is not a battery charger Air compressor should not be run for periods longer than 10 minutes without 10 minutes of cooling to prevent overheating. Overheating the compressor can reduce the life of the compressor and can permanently damage the compressor. You can't jump over your car using only the 12v DC cord - this cord is only intended for charging your PowerStation. Article ID : 00013416 / Last modified : 07/23/2019 The charging light may flash for the following reasons:The environmental temperature is too cold to charge the battery pack. The battery has not been used for a long time. There is a poor connection between the battery and the charger. There is a problem with the battery pack. The charging light may flash quickly (several times per second) or slow (about 1.5 seconds increments), depending on the cause. Slow flashing occurs if the battery has not been charged for a long time or if the environmental temperature is not suitable for charging the battery. The slow flash should stop after a short period of time or after the temperature returns to an appropriate interval between 50 ° F and 86 ° F (10 ° C and 30 ° C). Fast flashing indicates a poor connection between the battery and the charger or a problem with the battery pack. Remove the battery from the charger, and then use a dry cloth or cotton exchanger to clean the metal contact terminals on the battery. Then try charging the battery again. If the flashing continues, the battery may need to be replaced. Contact support parts and repair repair
